collections

we need a Collection to store the locations of the users.

```
@Locations = new Meteor.Collection "Locations"
```

We also add a user-schema, that allows us to store an additional property "locationTopic", that will hold the mqtt-topic.

```
Meteor.users.attachSchema new SimpleSchema
    services:
        type: Object
        optional: yes
        blackbox: yes
        autoform:
            omit: yes
    locationTopic:
        type: String
        label: "Location topic"
        optional: yes
```

@AdminConfig = collections: Locations: {}
